

How Greenlight used Anvilologic to Future-Proof their SOC on Snowflake

Greenlight is an Atlanta-based fintech that helps millions of families manage their finances through its award-winning platform. As the company scales rapidly in a highly regulated industry, Greenlight's security team plays a central role in protecting customer data and trust.

THEIR CHALLENGE

Greenlight's security team had all the right data, but couldn't use it. Splunk was slow, noisy, and expensive, and detections took too long to build and tune.

THEIR OBJECTIVE

- ▶ Cut SIEM costs and MTTR/MTTD
- ▶ Increase security coverage
- ◆ Implement AI-powered SOC automation

Greenlight then turned to Anvilologic to scale detection efforts across their Snowflake data

Greenlight offloaded high-volume logs to Snowflake, and used Anvilologic to automate SOC workflows to cut pricey SIEM costs

Deployed detection-as-code with Scenario Builder to reduce rule creation time.

Used automated MITRE benchmarking and curated detection content to fill high-impact coverage gaps.

\$600,000 saved

by eliminating legacy SIEM and automating SOC workflows

864 detections deployed

across 300+ real-world threat scenarios

25% → 80% MITRE coverage

increase in under 9 months

"Anvilologic modernized our SOC Operations with their AI SOC platform running on our Snowflake data. We scaled detections without adding headcount."
